

## **Above Property Data Center**

# Delaware North migrated 90% of systems in 4 months

Brian Alessi – Applications Manager

#### **Strategy**

#### **Business Objectives**

- Growth
- Enhanced customer experience 24/7 business
- Operational efficiency

#### IT Objectives

- Improve technical agility (legacy, speed to market)
- Maximize technical investments
- Refocus from traditional IT to customer focus

#### **Our Vision**

- Started 3 years ago with Cloud, mobile, SOA, network
- Solutions need to work operationally, technically and financially
- Start small, learn, incremental improvements
  - Cloud started with move of 50 websites to AWS including
    - KennedySpaceCenter.com, YosemitePark.com, DelawareNorth.com
    - Results operational, technical, financial
  - Set vision for Delaware North Data Center

## **Opportunity**

Use Data Center move costs to accelerate moving old Data Center to AWS.

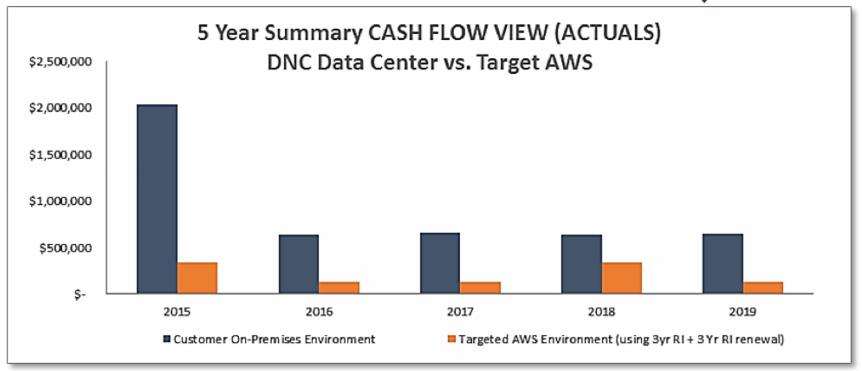

#### **Business Justification**

- Technical
  - Risk Assessment Reliability
  - Support Model
- Operational
  - Scalable, Fast to market
- Financial
  - Proforma Worked with AWS Business Development on TCO
  - ROI
  - Cost model

#### **Business Financials**

• We projected savings of \$3.5 million over 5 years on our run rate

## Research, Planning and Architecture

- Preparation
  - Inventory
  - Dependencies
  - Cross Team communications
- Security Baked in from the Start!
- Automation
- Governance
- Tracking the moving target
  - Agile Process

Very fast timeline soooo...... Resistance is futile!

#### **Partner Search**

- AWS Premier Consulting Partner
- AWS Managed Services
- 24/7 hours with offices in Europe,
   US and Canada

### Then we began our Journey

- Late February Mid June 2015
  - Architecture
  - Build
  - Lift + Shift
  - Continuous Optimization
  - Continuous Environmental Improvement

### **Today**

- Moved 225 of our corporate systems
- 90% of our corporate data center has been moved out
- Automating and continuous optimization and cost reduction
- Additional benefits
  - Better availability
  - Better uptime
  - Better data and reporting on our services

#### **Future**

- Transparent cost allocation model
- More focus on leveraging AWS cost model
  - A stadium might have 12 events per year
- Automation and continuous optimization
- Phase 2: Field Data Centers
  - 150+ locations begin migration
  - Some excellent economies of scale
  - POS / Admin
  - AWS Workspaces (PCs, POS)
  - DevOps

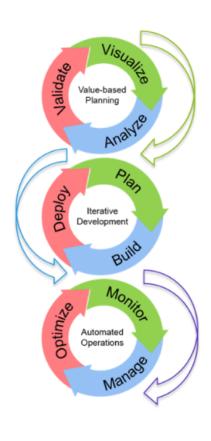

## An Agile Approach

**To the Migration Factory** 

### **Migration Methodology**

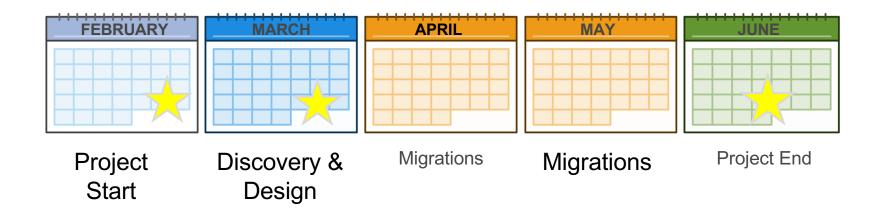

#### Three principal phases:

- 1. Assessment
- 2. Migration Factory
- 3. Optimisation

### **Project Timeline**

## **Estate Discovery**

### **Pre-Migration Estate**

- VMware estate
- Over-provisioned in places
- Legacy OSs
- Legacy apps

#### **Estate Discovery**

- How do you know what you have?
- Affinity between applications
- Automated tooling to clarify scope for migration
  - Speed
  - Accuracy
  - Confirmation
- No silver bullet We had a few "Oops" moments

## **Buildout and PCI Compliance**

#### **AWS Environment Build**

- Built using CloudFormation, Troposphere and Boto
- Entire network architecture version-controlled
- Custom CLI utility used for updates
- Governance automation checks policy compliance
- Alerting via HipChat for non-compliance

#### **PCI Considerations**

- Estate components subject to PCI compliance
- Source machines with no Internet access
- Dedicated:
  - AWS account
  - VPC
  - Direct Connect link
  - Access to instances
- Involve QSAs early

## **Migration Workflow**

### **Migration Workflow**

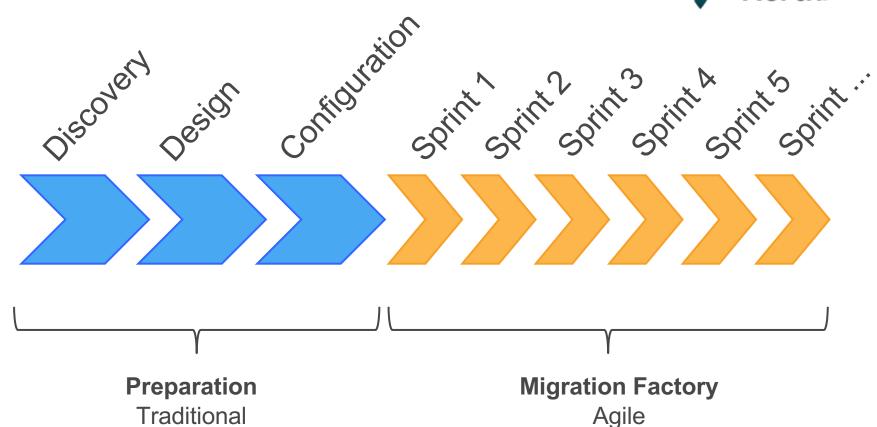

## Tips for a Successful Migration

## #1 - Velocity = Preparation + Agility

Agile

### #2 - Sprint for 100 Meters, not 400

#### Shorter sprints means:

More chances to show success to management

More sprint retros, so more frequent feedback

More momentum, higher velocity

### #3 - Play Poker

- Impossible to accurately estimate migration times
- Use relative complexity estimates
- Build a complexity baseline of points per week
- Complexity estimations during sprint planning

## CloudEndure as a Migration Tool

## **Migration Challenges**

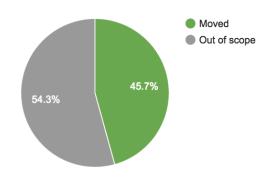

No Interruptions	
Low Cutover Times	
Multiple Applications and Operating Systems	
Converting On-premise Workloads to AWS	

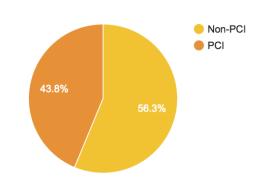

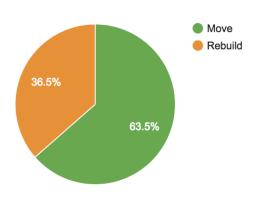

## **Achievements and Lessons**

### **Some Migration Statistics**

96 servers moved to AWS
114 out of scope inc.
~100 decommissioned

42 PCI/DMZ servers 54 non-PCI servers

61 Lift & Shift 35 Rebuilt

#### **Lessons Learned - What Worked**

- Migrations in Agile mode
- Adapting to customer's tooling
- Systematic LLD validation/sign-off
- Ability to take advantage of time zones
- Committed core team
  - Competing workloads managed so core team could remain focused

### **Lessons Learned - Challenges**

- PCI environment connectivity
- Need to shield migration team in war room
- Lift-and-shift first, optimize later
- Biggest Challenge:
  - Acceptance of change from larger IT group
  - Education of larger IT group

## Thank you!
